EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency Coal Combustion Residuals ("CCR") Rule (40 Code of Federal Regulations ("CFR") Part 257, Subpart D) ("CCR Rule"), this *2022 Annual Groundwater Monitoring Report* documents CCR groundwater monitoring activities completed in 2022 at Florida Power & Light Company's ("FPL") Gulf Clean Energy Center Ash Landfill No. 2 ("LF2").

FPL installed a CCR groundwater monitoring well network to monitor groundwater within the uppermost aquifer in the vicinity of LF2. Monitoring wells and piezometers in the LF2 CCR groundwater monitoring well network are listed below:

- background wells: MW-100, MW-101, MW-107, MW-108, MW-306, and MW-307;
- downgradient wells: MW-300, MW-303, MW-304, MW-305, and MW-308; and
- piezometers: MW-301 and MW-302.

Statistical evaluation of CCR groundwater monitoring data collected through October 2017 identified statistically significant increases ("SSIs") of certain CCR Rule Appendix III groundwater monitoring constituents relative to background levels. In accordance with the CCR Rule, FPL initiated an assessment monitoring program for LF2 in March 2018 and continued assessment monitoring activities for LF2 through 2022. Semi-annual assessment monitoring groundwater sample collection events for all CCR Rule Appendix III and Appendix IV constituents were conducted in March and September 2022.

In 2022, analytical data from the March and September 2022 groundwater sampling events were evaluated in accordance with the *Statistical Analysis Plan* ("SAP") (Groundwater Stats Consulting ("GSC"), 2017) and the *Statistical Analysis Method Certification, 40 CFR 257.93(f), Plant Crist Ash Landfill No. 2* ("SAMC") (Gulf Power Company, 2017). Statistical analysis of this data indicated SSIs of the following CCR Rule Appendix III constituents relative to background levels: boron, calcium, chloride, fluoride, sulfate, total dissolved solids ("TDS"), and pH.

SSI Constituent	Semi-Annual Assessment Monitoring Event	
	March 2022	September 2022
Boron	MW-303, MW-304, and MW-308	MW-303, MW-304, MW-305, and MW-308

SSI Constituent	Semi-Annual Assessment Monitoring Event	
	March 2022	September 2022
Chloride	MW-300, MW-303, MW-304, MW-305, and MW-308	MW-300, MW-303, MW-304, MW-305, and MW-308
Fluoride	MW-303 and MW-308	MW-305
pH	--	MW-305
Sulfate	MW-303, MW-304, MW-305, and MW-308	MW-303, MW-304, MW-305, and MW-308
TDS	MW-303, MW-304, and MW-308	MW-303, MW-304, MW-305, and MW-308

Statistical analysis also indicated statistically significant levels ("SSLs") of the following CCR Rule Appendix IV constituents above applicable groundwater protection standards ("GWPSs"):

SSL Constituent	Semi-Annual Assessment Monitoring Event	
	March 2022	September 2022
Radium 226 and 228 combined (total radium)	MW-303	MW-303
Molybdenum	MW-303	MW-303

In accordance with the CCR Rule, FPL previously conducted alternate source demonstrations ("ASDs") which document that molybdenum and total radium SSLs are from a source other than LF2. Accordingly, neither assessment of corrective measures nor remedial action will be performed for LF2 at this time. LF2 will remain in assessment monitoring in 2023.

1.0 INTRODUCTION

1.1 Overview

On behalf of Florida Power & Light Company ("FPL"), Geosyntec Consultants, Inc. ("Geosyntec") prepared this *2022 Annual Groundwater Monitoring Report* for FPL's Gulf Clean Energy Center ("GCEC") Coal Combustion Residuals ("CCR") unit Ash Landfill No. 2 ("LF2"). The purpose of this report is to present a summary of the CCR groundwater monitoring activities performed at LF2 in 2022. This report has been prepared in accordance with the annual reporting requirements of the CCR Rule found at 40 Code of Federal Regulations ("CFR") Section 257.90(e).

GCEC ("Site") is located at 11999 Pate Street in Pensacola, Escambia County, Florida, and is situated on approximately 670 acres. A Site location map is provided in **Figure 1**. Site topography ranges from approximately 120 feet ("ft") relative to the North American Vertical Datum of 1988 ("NAVD88") on the western portions of the Site and along Pate Street to approximately 5 ft NAVD88 near Clear Creek to the north and Governor's Bayou to the east. LF2 is located on the western portion of the Site.

1.2 Regional Geology & Hydrogeologic Setting

The Sand and Gravel Aquifer, the uppermost aquifer underlying the Site, includes Pleistocene terrace deposits, the Pleistocene Citronelle Formation, and the upper portion of the Pliocene/Miocene coarse clastics. The Sand and Gravel Aquifer has been subdivided into three major zones (listed in order from ground surface): (i) the surficial zone; (ii) the low permeability zone; and (iii) the main producing zone (Roaza et al., 1991).

The surficial zone consists of the upper most layer of sand and gravel, although layers of silt and clay may also occur within this zone. Beneath the surficial zone is the low permeability zone. The low permeability zone is the first substantial, more regionally continuous lower permeability layer encountered within the Sand and Gravel Aquifer (Roaza et al., 1991). This layer generally consists of a poorly sorted mixture of sand, silt, and clay, although actual lithology is variable. As a semi-confining interval, the low permeability zone limits vertical groundwater flow between the surficial zone above and the main producing zone below (Roaza et al., 1991). The main producing zone is lithologically similar to the surficial zone with moderate to well sorted quartz sands and gravels with interbedded layers of sandy clay and clay. Groundwater in the main

producing zone is under semi-confined conditions due to the nature of the low permeability zone that lies above and a regionally extensive confining unit that lies underneath (Richards, 2001).

Site-specific lithology in the uppermost aquifer consists primarily of silty or clayey sands interbedded with well-graded sands and gravels. Groundwater in the uppermost aquifer at the Site is generally encountered between 15 and 4 ft NAVD88 within the Sand and Gravel Aquifer in a laterally-extensive water-bearing zone of fine to coarse sand. This aquifer is considered the uppermost aquifer for groundwater monitoring purposes. CCR groundwater monitoring wells were screened in the uppermost aquifer at elevations shown in **Table 1**.

1.3 LF2 and Groundwater Monitoring System Descriptions

LF2 is a bottom ash landfill occupying approximately 15.2 acres.

Pursuant to the CCR Rule, FPL previously installed a CCR groundwater monitoring system around LF2 to monitor groundwater within the uppermost aquifer (Southern Company ("SC"), 2018). Background monitoring wells were installed to establish Site-wide background water quality. The downgradient monitoring well network was installed at the waste boundary. Monitoring wells in the LF2 groundwater monitoring network include:

- background wells: MW-100, MW-101, MW-107, MW-108, MW-306, and MW-307;
- downgradient wells: MW-300, MW-303, MW-304, MW-305, and MW-308; and
- piezometers: MW-301 and MW-302.

Monitoring well and piezometer details, including installation dates, coordinates, elevations, screen intervals, and designations are summarized in **Table 1**. The CCR groundwater monitoring well network for LF2 is illustrated on **Figure 2**.

2.0 GROUNDWATER MONITORING ACTIVITIES

The following section describes CCR groundwater monitoring-related activities performed in 2022.

2.1 Monitoring Well Installation and Maintenance

Monitoring well and piezometer installation activities were completed in 2015 and 2016 (SC, 2018). No additional monitoring wells were installed in 2022.

2.2 Semi-Annual Assessment Monitoring Events

Semi-annual assessment monitoring events were conducted in March and September 2022. During the 2022 semi-annual assessment monitoring events, groundwater samples were collected from each monitoring well shown on **Figure 2** and analyzed for CCR Rule Appendix III and Appendix IV constituents. A summary of groundwater sample collection events completed in 2022 is provided in **Table 2**. Groundwater analytical data associated with these events are summarized in **Table 3** and laboratory analytical reports are included in **Appendix A**.

3.0 SAMPLE METHODOLOGY & RESULTS

The following section describes the methods used to conduct CCR groundwater monitoring at LF2. Results for CCR Rule Appendix III and Appendix IV constituents are discussed in Section 4.

3.1 Groundwater Elevation Measurement

Prior to each CCR sample collection event, the depth to groundwater was recorded at each CCR groundwater monitoring well. Groundwater elevations calculated from the depth to groundwater measurements recorded during the semi-annual assessment monitoring events are summarized in **Table 4**. Site-wide groundwater elevation maps developed using groundwater elevation data from each CCR groundwater monitoring event are presented in **Figure 3** and **Figure 4**.

As illustrated on the March 2022 and September 2022 groundwater elevation maps (**Figures 3** and **4**), the general direction of groundwater flow near LF2 is to the northeast. The groundwater flow patterns observed during the March 2022 and September 2022 assessment monitoring events were generally consistent with observations from 2021 (Geosyntec, 2022).

3.2 Groundwater Gradient and Flow Velocity

Groundwater flow rates were calculated based on hydraulic gradients estimated from groundwater elevations measured during each sampling event and hydraulic conductivity (31 feet per day [ft/day]) documented in the *Hydrogeological and Geotechnical Investigation Report* (SC Generation, 2007). The horizontal hydraulic gradients between MW-301 and MW-304 were calculated based on groundwater elevation data from the 2022 sampling events, resulting in horizontal gradients of approximately 0.004 ft/ft and 0.003 ft/ft between the well pair in March and September 2022, respectively.

Horizontal flow velocity was calculated using a form of Darcy's Law:

$V=(K*i)/n_e$

Where:

V=groundwater velocity (ft/day);

K=measured hydraulic conductivity (ft/day);

i=horizontal hydraulic gradient (ft/ft); and

n_e=effective porosity (unitless), which was assumed to be 0.25.

The calculated horizontal groundwater velocities between MW-301 and MW-304 were 0.5 ft/day (164 ft/year) and 0.4 ft/day (147 ft/year) in March and September 2022, respectively.

3.3 Groundwater Sampling

Groundwater samples were collected in accordance with Florida Department of Environmental Protection ("FDEP") Standard Operating Procedures FS2200 (FDEP, 2017) and the CCR Rule. Field instruments were used to monitor and record field water quality parameters (pH, conductivity, oxidation reduction potential, and dissolved oxygen) during well purging to evaluate stabilization prior to sampling. Turbidity was measured using a portable turbidimeter. Following sample collection, samples were placed in ice-packed coolers and submitted to Eurofins TestAmerica Laboratories, Inc. ("TAL"), in Pensacola, Florida following chain-of-custody protocol. Field sampling data sheets are provided in **Appendix A**.

3.4 Laboratory Analyses

Laboratory analyses for groundwater samples collected during the semi-annual assessment monitoring events included both CCR Rule Appendix III and Appendix IV constituents. Applicable analytical methods are provided in laboratory reports (**Appendix A**).

Laboratory analyses were performed by TAL. TAL is accredited by the National Environmental Laboratory Accreditation Program ("NELAP") and maintains a NELAP certification for all parameters analyzed for this project. In addition, TAL is certified to perform laboratory analyses by the State of Florida. Groundwater data and chain-of-custody records for the two semi-annual assessment monitoring events are presented in **Appendix A**.

3.5 Quality Assurance & Quality Control Summary

During each sampling event, quality assurance/quality control ("QA/QC") samples including equipment blanks, field blanks, and duplicate samples were collected. Data from these QA/QC samples were evaluated during data validation.

Groundwater quality data from March 2022 were independently validated in accordance with *Region IV Data Validation Standard Operating procedures* (United States Environmental Protection Agency ("USEPA"), 2011) and the analytical methods employed. Data validation generally consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spikes/matrix spike duplicate recoveries and relative percent differences ("RPDs"), post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits. Where appropriate, validation qualifiers and flags are applied to the data using *the National Functional Guidelines for Inorganic Superfund Methods Data Review,* (USEPA, 2017). Data validation reports for the March semi-annual assessment monitoring events are included in **Appendix A**. The data validation report along with revised laboratory reports for the September 2022 semi-annual assessment monitoring event will be included in the 2023 annual report.

4.0 STATISTICAL ANALYSIS

The following section describes the statistical methods and analyses performed in 2022.

4.1 Statistical Method

Statistical analysis of CCR Rule Appendix III and Appendix IV constituents was performed on groundwater monitoring data collected during the March 2022 and September 2022 semi-annual assessment monitoring events in accordance with the *Statistical Analysis Plan* ("SAP") (Groundwater Stats Consulting ("GSC"), 2017) and the *Statistical Analysis Method Certification, 40 CFR 257.93(f), Plant Crist Ash Landfill No. 2* ("SAMC") (Gulf Power Company, 2017).

Statistical analysis of LF2 CCR groundwater data was performed using the Sanitas™ v.9.6.28 groundwater statistical software. Sanitas™ is a decision support software package that incorporates statistical tests required of Subtitle C and D facilities by the USEPA regulations and incorporates methods recommended in the *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance* (USEPA, 2009), consistent with the SAP (GSC, 2017) and the SAMC (Gulf Power Company, 2017).

4.1.1 Appendix III Constituent Statistical Method

Statistical analysis of CCR Rule Appendix III constituents was performed to evaluate if concentrations were consistent with observed background values. Statistical tests used to evaluate the CCR groundwater monitoring data consisted of interwell prediction limits combined with a 1-of-2 resample strategy for the following Appendix III constituents: boron, calcium, chloride, fluoride, sulfate, and total dissolved solids ("TDS"). Interwell prediction limits pool upgradient well data to establish a background prediction limit for an individual constituent, and the most recent sample from each downgradient well is compared to the background prediction limit for each constituent. Intrawell prediction limits combined with a 1-of-2 resample strategy were used to evaluate pH at each well. Intrawell prediction limits are constructed using historical data within a given well and compare the most recent sample to background levels within the same well. The 1-of-2 resample strategy allows for collection of a verification sample when statistically significant increases ("SSIs") are identified. If the most recent sample exceeded its respective background prediction limit and a verification sample is not collected, an SSI is identified.

4.1.2 Appendix IV Constituent Statistical Method

In accordance with the CCR Rule, groundwater protection standards ("GWPSs") for Appendix IV constituents were established and are presented in **Table 5**.

To evaluate statistically significant levels ("SSLs") of CCR Rule Appendix IV constituents, confidence intervals were constructed for each Appendix IV constituent in each downgradient well and compared to the GWPSs (**Table 5**). An SSL is identified only when the entire confidence interval is above the GWPS. Other statistical tests including time-series plots and trend analyses were performed in accordance with the SAP (GSC, 2017) and the SAMC (Gulf Power Company, 2017). Additional details are presented in the statistical analysis reports for the March 2022 and September 2022 semi-annual assessment monitoring events provided in **Appendices B** and **C**, respectively**.**

4.2 Statistical Analysis Results

Analytical data from the March 2022 and September 2022 semi-annual assessment monitoring events were analyzed in accordance with the SAP (GSC, 2017) and the SAMC (Gulf Power Company, 2017). Appendix III statistical analysis was performed to evaluate if constituent concentrations in groundwater were consistent with background levels. CCR Rule Appendix IV constituents were evaluated to assess if groundwater concentrations statistically exceeded the established GWPSs.

4.2.1 Appendix III Constituents Statistical Results

Concentrations of select CCR Rule Appendix III constituents from samples collected during the March 2022 and September 2022 semi-annual assessment monitoring events differed from background levels. SSIs were identified for the following constituents: boron, calcium, chloride, fluoride, pH, sulfate, and TDS.

SSI Constituent	Semi-Annual Assessment Monitoring Event	
	March 2022	September 2022
Boron	MW-303, MW-304, and MW-308	MW-303, MW-304, MW-305, and MW-308
Calcium	MW-303, MW-304, MW-305, and MW-308	MW-303, MW-304, MW-305, and MW-308
Chloride	MW-300, MW-303, MW-304, MW-305, and MW-308	MW-300, MW-303, MW-304, MW-305, and MW-308

SSI Constituent	Semi-Annual Assessment Monitoring Event	
	March 2022	September 2022
Fluoride	MW-303 and MW-308	MW-305
pH	--	MW-305
Sulfate	MW-303, MW-304, MW-305, and MW-308	MW-303, MW-304, MW-305, and MW-308
TDS	MW-303, MW-304, and MW-308	MW-303, MW-304, MW-305, and MW-308

Based on these SSIs, assessment monitoring will continue in 2023.

4.2.2 Appendix IV Constituents Statistical Results

Statistical analysis of CCR Rule Appendix IV constituents identified the following SSLs:

SSL Constituent	Semi-annual Assessment Monitoring Event	
	March 2022	September 2022
Radium 226 and 228 combined (total radium)	MW-303	MW-303
Molybdenum	MW-303	MW-303

5.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with the CCR Rule, FPL previously prepared Alternate Source Demonstrations ("ASDs") for molybdenum (Geosyntec, 2019) and total radium (Geosyntec, 2021).

Key conclusions of the ASDs for the SSLs identified in 2022 are briefly summarized below:

- Based on an analysis of the groundwater elevation data, monitoring well MW-303 is downgradient of the Closed Interim Landfill ("CIL") which is south of LF2. Elevated molybdenum levels were observed in groundwater up/side gradient of LF2 and downgradient of the CIL. Additionally, molybdenum was detected in sediment and surface water of the stormwater pond associated with CIL, but not detected in the surface water of the stormwater pond associated with LF2. Therefore, data indicate that the source of the SSL reported for molybdenum in MW-303 is not LF2.

- Naturally-occurring uranium and thorium, both of which decay to radium isotopes, were documented at the Site in an investigation by LBG-Guyton (1998), the results of which were concurred with by FDEP in the *Summary of the February 10, 1999 Meeting with Gulf Power* (FDEP, 1999). The naturally-occurring parent radionuclides and subsequent decay to the components of total radium accounts for the periodic GWPS exceedances observed in LF2 CCR groundwater monitoring well MW-303. Therefore, data indicate that total radium is leaching into groundwater from naturally-occurring radioactive elements in Site soils causing SSLs of total radium in groundwater.

6.0 CONCLUSIONS & FUTURE ACTIONS

SSLs of certain CCR Rule Appendix IV constituents (molybdenum and total radium) relative to GWPSs were identified at LF2 in 2022. In accordance with the CCR Rule, an ASD was previously prepared for the SSLs which document that a source other than LF2 is the cause of the SSLs. Therefore, an assessment of corrective measures will not be performed at this time and assessment monitoring will continue in 2023.

2. "TDS" indicates total dissolved solids.
3. "U" indicates analyte was analyzed but not detected.
4. "V" indicates that the analyte was detected at or above the method detection limit in both the sample and associated method blank and the value of 10 times the blank was equal to or greater than the associated sample value (i.e., the reported concentration may be biased high).
5. "I" indicates that the reported value is between laboratory method detection limit and laboratory practical quantitation limit.
6. Data validation is being performed on both the semi-annual assessment monitoring (AM01 & AM02) events of 2022. Data validation flags are not included in Table 3. Data validation reports for 2022 AM01 data are included in Appendix A. Data validation reports for 2022 AM02 data will be included in the 2023 annual report.
7. Total radium is defined as the combined concentrations of radium 226 and radium 228.

Metals
Method 6020: The CRI associated with batch 400-571318 recovered above the upper control limit for Cadmium. The samples associated with this CRI were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CRI 400-571318/24).

Method 6020: The CRI associated with batch 400-571318 recovered above the upper control limit for Lithium. The samples associated with this CRI were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CRI 400-571318/24).

General Chemistry
Method SM 2540C: The sample duplicate (DUP) precision for analytical batch 400-571426 was outside control limits. Sample non-homogeneity is suspected.

Method SM 4500 F C: The matrix spike (MS) recoveries for analytical batch 400-572170 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method SM 4500 F C: The matrix spike duplicate (MS/MSD) recoveries and precision for analytical batch 400-572170 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method SM 4500 SO4 E: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 400-573459 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Job Narrative
400-217387-2

Receipt
The samples were received on 3/23/2022 3:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6º C and 4.5º C.

RAD
Method 9315: Radium-226 batch 557819. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. MW-100 (400-217387-1), MW-101 (400-217387-2), MW-107 (400-217387-3), MW-108 (400-217387-4), MW-306 (400-217387-5), MW-307 (400-217387-6), DUP-01 (400-217387-7), (LCS 160-557819/1-A), (LCSD 160-557819/2-A) and (MB 160-557819/20-A)

Method 9320: Radium-228 batch 557820. The LCS/LCSD recovered at (131% & 128%). The limits in our LIMS system at 75-125 reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS/LCSD are not from this agency and are therefore held to our in-house statistical limits of (61-138%) per method requirements. The LCS/LCSD passes, no further action is required. (LCS 160-557820/1-A) and (LCSD 160-557820/2-A)

Narrative

Job Narrative
400-217487-1

Metals
Method 6020: The sample is unable to be ran at 1x due to high concentration of Boron. Due to this inability, the following samples are able to be reported at 5x dilution. MW-303 (400-217487-2), MW-304 (400-217487-3) and MW-308 (400-217487-5)

Method 7470A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-572703 and analytical batch 400-573009 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

General Chemistry
Method SM 2540C: The sample duplicate (DUP) precision for analytical batch 400-571426 was outside control limits. Sample non-homogeneity is suspected.

Method SM 2540C: The sample duplicate (DUP) precision for analytical batch 400-571428 was outside control limits. Sample non-homogeneity is suspected.

Method SM 4500 F C: The matrix spike duplicate (MSD) recoveries and precision for analytical batch 400-573137 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method SM 4500 Cl- E: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-304 (400-217487-3) and MW-308 (400-217487-5). Elevated reporting limits (RLs) are provided.

Method SM 4500 SO4 E: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-303 (400-217487-2), MW-304 (400-217487-3) and MW-308 (400-217487-5). Elevated reporting limits (RLs) are provided.

Method SM 4500 SO4 E: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 400-573460 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Receipt
The samples were received on 3/24/2022 3:05 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 1.9º C, 4.7º C, 5.0º C and 5.8º C.

RAD
Method 9315: Radium-226 batch 557819. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. MW-300 (400-217487-1), MW-303 (400-217487-2), MW-304 (400-217487-3), MW-305 (400-217487-4), MW-308 (400-217487-5), DUP-03 (400-217487-6), FB-02 (400-217487-7), EB-02 (400-217487-8), (LCS 160-557819/1-A), (LCSD 160-557819/2-A) and (MB 160-557819/20-A)

Method 9320: Radium-228 batch 557820. The LCS/LCSD recovered at (131% & 128%). The limits in our LIMS system at 75-125 reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS/LCSD are not from this agency and are therefore held to our in-house statistical limits of (61-138%) per method requirements. The LCS/LCSD passes, no further action is required. (LCS 160-557820/1-A) and (LCSD 160-557820/2-A)

Method PrecSep_0: Radium-228 Prep Batch 160-557820. The following samples were prepared at a reduced aliquot due to Matrix: MW-300 (400-217487-1) and MW-303 (400-217487-2). A laboratory control sample/ laboratory control sample duplicate (LCS/LCSD) were prepared instead of a sample duplicate (DUP) to demonstrate batch precision.

1.1 Overall Assessment

1.1.1 Completeness

The metals data reported in this sample set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

1.1.2 Analysis Anomaly

400-217387-1: The laboratory noted the recoveries of cadmium and lithium in the contract required detection limit verification standard (CRI) in batch 571318 were high and outside of the method specified acceptance criteria. Since only QC samples were analyzed in batch 571318, no qualifications were applied to the data.

400-217541-1: The laboratory noted the recovery of boron in the CRI in batch 571781 was high and outside of the method specified acceptance criteria. Since the boron concentrations in MW-200 and EB-03 were U qualified due to method blank contamination and based on the concentrations detected in FB-03, and professional and technical judgment, no additional qualifications were applied to the data.

400-217541-1: The laboratory noted the replicate relative standard deviations (RSDs) of the metals in the initial calibration verifications (ICVs) in batches 572626 and 572969 were outside of the method specified acceptance criteria; however, the ICV recoveries were within the method specified acceptance criteria. Since the ICV recoveries were within the method specified

acceptance criteria and based on professional and technical judgement, no qualifications were applied to the data.

400-217541-1: The laboratory noted that boron was detected at a concentration greater than the reporting limit (RL) in the continuing calibration blank (CCB) in batches 572626 and 572781. Since the associated samples were qualified due to method blank contamination, no additional qualifications were applied to the data, based on professional and technical judgment.

400-217651-1: The laboratory noted the replicate RSDs of the metals in the ICV in batch 573081 were outside of the method specified acceptance criteria; however, the ICV recoveries were within the method specified acceptance criteria. Since the ICV recoveries were within the method specified acceptance criteria and based on professional and technical judgement, no qualifications were applied to the data.

1.2 Holding Time

The holding time for the metals analysis of a preserved water sample is 180 days from sample collection to analysis. The holding times were met for the sample analyses.

1.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Six method blanks were reported (batches 571206, 571729, 571722, 572424, 573010 and 585627). Metals were not detected in the method blanks at or above the method detection limits (MDLs), with the following exceptions.

400-217387-1, 400-217490-1, 400-217538-1 and 400-217541-1: Boron was detected in the method blanks in batches 571206, 571722 and 572424 at estimated concentrations greater than or equal to the MDLs and less than the RLs. Therefore, the estimated boron concentrations in the samples MW-306, MW-307, DUP-01, MW-200, EB-01, MW-106 and EB-03 were U qualified as not detected at the RL, and the boron concentrations in samples MW-100, MW-101, MW-107, MW-108, MW-102 and FB-01 were J+ qualified as estimated with a high bias.

**Reason codes are defined in Attachment 2 at the end of this report

1.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

Two sample set specific MS/MSD pairs were reported, both using sample MW-102. The recovery and RPD results were within the laboratory specified acceptance criteria.

Six batch MS/MSD pairs were reported. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

1.5 Laboratory Duplicate

Two sample set specific laboratory were reported using samples MW-201 and MW-206. The recovery and RPD results were within the laboratory specified acceptance criteria.

1.6 Laboratory Control Sample (LCS)

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Five LCSs and one LCS/LCS duplicate (LCSD) pair were reported. The recovery and RPD results were within the laboratory specified acceptance criteria.

1.7 Equipment Blank

Three equipment blanks, EB-01, EB-02 and EB-03, were collected with the sample set. Metals were not detected in the equipment blanks at or above the MDLs, with the following exceptions.

Boron was detected in EB-01 and EB-02 at estimated concentrations greater than or equal to the MDL and less than the RL. Since the boron concentrations in EB-01 and EB-02 were U qualified due to field blank contamination and based on professional and technical judgment, no additional qualifications were applied to the data.

Boron and chromium were detected in EB-03 at estimated concentrations greater than or equal to the MDLs and less than the RLs. Since the boron concentration in EB-03 was U qualified due to method blank contamination and based on professional and technical judgment, no additional qualifications were applied to the data.

1.8 Field Blank

Three field blanks, FB-01, FB-02 and FB-03, were collected with the sample set. Metals were not detected in the field blanks at or above the MDLs, with the following exceptions.

Boron (0.017 mg/L) was detected in FB-01 at a concentration greater than the RL. Since the boron concentration in the associated samples were qualified due to method blank contamination and based on professional and technical judgment, no additional qualifications were applied to the data.

Boron was detected in FB-02 at an estimated concentration greater than or equal to the MDL and less than the RL. Therefore, the estimated boron concentration in sample EB-02 was U qualified as not detected at the RL.

Barium (0.023 mg/L), boron (1.8 mg/L), calcium (58 mg/L) and selenium (0.0033 mg/L) were detected in FB-03 at concentrations greater than the RLs and cobalt was detected at an estimated concentration greater than or equal to the MDL and less than the RL. Therefore, the barium, boron and calcium concentrations in samples MW-202, MW-203, MW-204, MW-205 and DUP-04 were J+ qualified as estimated with a high bias.

1.9 Field Duplicate

Six field duplicates were collected with the sample set, DUP-01 (400-217387), DUP-01 (400-217490), DUP-01 (400-217651), DUP-02, DUP-03 and DUP-04. Acceptable precision (RPD≤ 30%) was demonstrated between the field duplicates and the original samples, MW-307, MW-105, PZ-201D, MW-2032/GE-1D, MW-305 and MW-203, respectively, with the following exceptions.

Lithium was detected in DUP-01 (400-217387) at a concentration greater than the RL and not detected in sample MW-307, resulting in noncalculable RPD. Therefore, the lithium concentration in DUP-01 (400-217387) was J qualified as estimated, and the non-detect lithium result in MW-307 was UJ qualified as estimated less than the MDL.

The boron RPD for field duplicate pair DUP-01 (400-217490) /MW-105 was greater than 30%. Therefore, the boron concentrations in this field duplicate pair were J qualified as estimated.

Selenium was detected in sample MW-203 at a concentration greater than the RL and detected in sample DUP-04 at an estimated concentration greater than or equal to the MDL and less than the RL, resulting in a noncalculable RPD. Therefore, the selenium concentrations in samples MW-203 and DUP-04 were J qualified as estimated.

Chromium was detected in sample DUP-04 at a concentration greater than the RL and detected in sample MW-203 at an estimated concentration greater than or equal to the MDL and less than the RL, resulting in a noncalculable RPD. Therefore, the chromium concentrations in samples MW-203 and DUP-04 were J qualified as estimated.

Arsenic was not detected in DUP-01 (400-217651) and detected in PZ-201D at an estimated concentration greater than or equal to the MDL and less than the RL, resulting in a noncalculable RPD. Therefore, the non-detect cadmium result in DUP-01 (400-217651) was UJ qualified as estimated less than the MDL, and the cadmium concentration in PZ-201D was J qualified as estimated.

The chromium and lead RPDs for field duplicate pair DUP-02/ MW2032/GE-1D were greater than 30%. Therefore, the chromium and lead concentrations in this field duplicate pair were J qualified as estimated.

3.1 Overall Assessment

The wet chemistry data reported in this sample set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for these analyses, for this dataset is 100%.

400-217387-1: The recoveries of sulfate in the MS/MSD pairs using samples MW-101 and MW-107 were low and outside of the laboratory specified acceptance criteria. Therefore, the non-detect results of sulfate in samples MW-101 and MW-107 were UJ qualified as estimated less than the MDL.

400-217487-1: The recoveries of sulfate in the MS/MSD pair using sample MW-300 were low and outside of the laboratory specified acceptance criteria. Therefore, the non-detect result of sulfate in sample MW-300 was UJ qualified as estimated less than the MDL.

400-217490-1: The RPD of fluoride in the MS/MSD pair using sample FB-01 was high and outside of the laboratory specified acceptance criteria. Since fluoride was not detected in sample FB-01, no qualifications were applied to the data.

3.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported for each analysis and batch. 3.6 Laboratory Duplicate

Two sample set specific laboratory duplicates were reported for TDS using samples MW-109, DUP-04 and MW2032/GE-1D.

The RPDs of TDS in the laboratory duplicates using samples DUP-04 and MW2032/GE-1D were high and outside of the laboratory specified acceptance criteria. Therefore, the TDS concentrations in samples DUP-04 and MW2032/GE-1D were J qualified as estimated.

Batch laboratory duplicates were also reported for TDS. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

3.7 Equipment Blank

Four equipment blanks, EB-01, EB-02 and EB-03, were collected with the sample set. The wet chemistry parameters were not detected in the equipment blanks at or above the MDLs.

3.8 Field Blank

Four field blanks, FB-01, FB-02 and FB-03 were collected with the sample set. The wet chemistry parameters were not detected in the field blanks at or above the MDLs, with the following exception.

400-217487-1: TDS (8.0 mg/L) was detected in FB-02 at a concentration greater than the RL. Therefore, the TDS concentrations in sample MW-300 and MW-305 were J+ qualified as estimated with high biases.

Sample	Analyte	Laboratory Result (mg/l)	Laboratory Flag	Validation Result (mg/l)	Validation Qualifier	Reason Code
MW-300	TDS	16	NA	16	J+	3
MW-305	TDS	62	NA	62	J+	3

3.9 Field Duplicate

Six field duplicates were collected with the sample set, DUP-01 (400-217387), DUP-01 (400-217490), DUP-01 (400-217651), DUP-02, DUP-03 and DUP-04. Acceptable precision (RPD≤ 30%) was demonstrated between the field duplicates and the original samples, MW-307, MW-105, PZ-201D, MW-2032/GE-1D, MW-305 and MW-203, respectively, with the following exceptions.

The RPD of TDS in field duplicate pairs MW-307/DUP-01 (400-217387), MW-305/DUP-03, PZ-201-D/DUP-01 (400-217651) and MW2032/GE-1D/DUP-02 were greater than 30%; therefore, the TDS concentrations in field duplicate pairs MW-/DUP-01 (400-217387), MW-305/DUP-03, PZ-201-D/DUP-01 (400-217651) and MW2032/GE-1D/DUP-02 were J qualified as estimated.

Fluoride was detected in DUP-03 at an estimated concentration greater than or equal to the MDL and less than the RL and not detected in sample MW-305, resulting in a noncalculable RPD. Therefore, the fluoride concentration in DUP-03 was J qualified as estimated and the non-detect result of fluoride in MW-305 was UJ qualified as estimated less than the MDL.

3.10 Sensitivity

The samples were reported to the MDLs. Elevated non-detect results were not reported.

3.11 Electronic Data Deliverables Review

The results and sample IDs in the EDDs were reviewed against the information provided by the associated level II reports at a minimum of 20% as part of the data validation process. No discrepancies were identified between the level II reports and the EDDs.

DATA QUALIFIER DEFINITIONS

U The analyte was analyzed for but was not detected at or above the reported sample quantitation limit. Upon application of the U qualifier to a reported result, the definition changes to "not detected at or above the reported result".

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

J+ The analyte was positively identified; however, the associated numerical value is likely to be higher than the concentration of the analyte in the sample due to positive bias of associated QC or calibration data or attributable to matrix interference.

J- The analyte was positively identified; however, the associated numerical value is likely to be lower than the concentration of the analyte in the sample due to negative bias of associated QC or calibration data or attributable to matrix interference.

UJ The analyte was not detected at or above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

1.1 Overall Assessment

1.1.1 Completeness

The radium-226 and radium-228 data reported in this sample set are considered usable for meeting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this sample set is 100%.

1.1.2 Analysis Anomaly

400-217490-2 and 400-217651-2: Radium-226 and radium-228 were detected at concentrations less than the minimum detectable concentrations (MDCs)in samples FB-01 and PZ-201D; however, the combined radium 226 + 228 concentrations were indicated as being greater than the MDCs. Since both radium-226 and radium-228 were less than the MDCs, radium 226 + 228 was calculated form the radium-226 and radium-228 concentrations and based on professional and technical judgment, the combined radium 226 + 228 concentration in samples FB-01 and PZ-201D were U qualified as not detected at or above the MDCs.

Sample	Analyte	Laboratory Result (pCi/L)	Laboratory Flag	Validation Result (pCi/L)	Validation Qualifier*	Reason Code**
FB-01	Combined Radium 226 + 228	0.693	NA	0.693	U	13

* Validation qualifiers are defined in Attachment 1 at the end of this report
**Reason codes are defined in Attachment 2 at the end of this report

1.2 Holding Times

The holding time for the radium-226 and radium-228 analyses of a water sample is 180 days from sample collection to analysis. The holding times were met for the sample analyses.

1.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Four method blanks were reported for radium-226 (batches 557819, 557822, 557866 and 558514) and four method blanks were reported for radium-228 (batches 557820, 557824, 558008 and 558519). The radiochemistry parameters were not detected in the method blanks above the MDCs.

1.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

MS/MSD pairs were not reported.

1.5 Laboratory Control Sample (LCS)

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Four LCS/laboratory control sample duplicate (LCSD) pairs were reported for radium-226 and four LCS/LCSD pair were reported for radium-228. The recovery and replicate error ratio (RER) results were within the laboratory specified acceptance criteria, with the following exceptions.

400-217387-2 and 400-217487-2: The recoveries of radium-228 in the LCS/LCSD pair in batch 557820 were high and outside of the laboratory specified acceptance criteria. Therefore, the concentrations of radium-228 and combined radium 226 and 228 in the associated samples were J qualified as estimated.

1.6 Tracers and Carriers

Carriers were reported for the radium-226 and radium-228 analyses. The recovery results were within the laboratory specified acceptance criteria.

1.7 Equipment Blank

Three equipment blanks were collected with the sample set, EB-01, EB-02 and EB-03. The radiochemistry parameters were not detected in the equipment blanks above the MDCs.

1.8 Field Blank

Three field blanks were collected with the sample set, FB-01, FB-02 and FB-03. The radiochemistry parameters were not detected in the field blanks above the MDCs, with the following exception.

400-217490-2 – Combined Radium-226 and 228 was reported in FB-01 at a concentration greater than the MDC. Since the Radium 226 and Radium 228 were not detected at concentrations greater than the MDCs and based on professional and technical judgment, no qualifications were applied to the data.

1.9 Field Duplicate

Six field duplicates were collected with the sample set, DUP-01 (400-217387-2), DUP-01 (400-217490-2), DUP-01 (400-217651-2), DUP-02, DUP-03 and DUP-04. Acceptable precision (RER≤

3) was demonstrated between the field duplicates and the original samples, MW-307, MW-105, PZ-201D, MW-2032/GE-1D, MW-305 and MW-203, respectively.

1.10 Sensitivity

The samples were reported to the MDCs. Elevated non-detect results were not reported.

1.11 Electronic Data Deliverables (EDDs) Review

The results and sample IDs in the EDDs were reviewed against the information provided by the associated level II reports at a minimum of 20% as part of the data validation process. No discrepancies were identified between the level II reports and the EDDs.

Comments
Due to supply chain issues, Fluoride had to be run by method 300 instead of 4500. This may cause a deviation from the historic results.

Receipt
The samples were received on 9/8/2022 4:38 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.1º C and 0.3º C.

Metals
Method 6020: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-592467 and analytical batch 400-593289 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6020: The matrix spike / matrix spike duplicate (MS/MSD) precision for preparation batch 400-592467 and analytical batch 400-593289 was outside control limits. Sample matrix interference is suspected.

Method 6020: The ICV for batch 400-593462 passed recovery/accuracy criteria which serves the ICV purpose of verifying the calibration standards. The replicate RPDs for the elements were outside of the criteria for standards but within the criteria for field samples. Data has therefore been reported and narrated accordingly.

Method 7470A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-593355 and analytical batch 400-594213 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6020: The continuing calibration verification (CCV) associated with batch 400-593804 recovered below the lower control limit for Boron. The laboratory control spike associated with this CCV was within the acceptable limit for the affected analytes; therefore, the data have been reported.

Method 6020: The method blank for preparation batch 400-592467 and analytical batch 400-593804 contained Boron above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

General Chemistry
Method SM 2540C: The analysis volume selected for the following samples produced a base result greater than 200mg before calculation of the final result: (400-225433-B-14) and (400-225433-B-14 DU). Reanalysis could not be performed due to holding time exceedance, or due to the matrix, 5ml was used for the method. The sample aliquot was over the method accepted range. Using a smaller amount will prevent the ability to obtain a representative aliquot for the method. As such, 5ml is being reported or annotated. The reference method specifies that no more than 200mg of weight be recovered for a chosen sample analysis volume in order to produce the best data precision. As such, these data have been qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt
The samples were received on 9/8/2022 4:38 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.1º C and 0.3º C.

RAD
Method 9315: Radium-226 batch 582040. The method blank (MB) z-score is within limits and is stored in the level IV raw data. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. MW-100 (400-225667-1), (LCS 160-582040/2-A), (MB 160-582040/1-A), (280-166284-A-2-A) and (280-166284-A-2-B DU)

Method 9315: Radium-226 batch 581883. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. MW-101 (400-225667-2), MW-107 (400-225667-3), MW-108 (400-225667-4), MW-306 (400-225667-5), MW-307 (400-225667-6), DUP-01 (400-225667-7), EB-01 (400-225667-8), FB-01 (400-225667-9), (LCS 160-581883/2-A), (LCSD 160-581883/3-A) and (MB 160-581883/1-A)

Method 9320: Radium-228 batch 582045. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. MW-100 (400-225667-1), (LCS 160-582045/2-A), (MB 160-582045/1-A), (280-166284-A-2-C) and (280-166284-A-2-D DU)

Method 9320: Radium-228 batch 582045. The bracketing daily (check), run the day after the sample was run, was slightly outsic the established QC criteria. The efficiency is set at 3% and the bracketing check achieved 3.2%.The daily (check) run the day th sample was run, passed. Additionally the affected sample achieved its detection goal and was the sample chosen as the batch duplicate. The precision was within acceptable QC limits demonstrating acceptable method and instrument performance. Origin results will be reported. (280-166284-A-2-C)

Method 9320: Radium-228 batch 581888. The LCSD recovered at (128%). The limits in our LIMS system at 75-125 reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS are not from this agency and are therefore held to our in-house statistical limits of (62-148%) per method requirements. The LCS passes, no further action is required. (LCSD 160-581888/3-A)

Method 9320: Radium-228 batch 581888. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. MW-101 (400-225667-2), MW-107 (400-225667-3), MW-108 (400-225667-4), MW-306 (400-225667-5), MW-307 (400-225667-6), DUP-01 (400-225667-7), EB-01 (400-225667-8), FB-01 (400-225667-9), (LCS 160-581888/2-A), (LCSD 160-581888/3-A) and (MB 160-581888/1-A)

Method PrecSep_0: Radium 228 Batch 160-581888. Insufficient sample volume was available to perform a sample duplicate for following samples: MW-101 (400-225667-2), MW-107 (400-225667-3), MW-108 (400-225667-4), MW-306 (400-225667-5), MW- (400-225667-6), DUP-01 (400-225667-7), EB-01 (400-225667-8) and FB-01 (400-225667-9). A laboratory control sample/ labor control sample duplicate (LCS/LCSD) were prepared instead to demonstrate batch precision.

Method PrecSep-21: Radium 226 Batch 160-581883. Insufficient sample volume was available to perform a sample duplicate fo the following samples: MW-101 (400-225667-2), MW-107 (400-225667-3), MW-108 (400-225667-4), MW-306 (400-225667-5), MW-307 (400-225667-6), DUP-01 (400-225667-7), EB-01 (400-225667-8) and FB-01 (400-225667-9). A laboratory control samp laboratory control sample duplicate (LCS/LCSD) were prepared instead to demonstrate batch precision.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
Due to supply chain issues, Fluoride had to be run by method 300 instead of 4500. This may cause a deviation from the historic results.

Receipt
The samples were received on 9/12/2022 4:55 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 2.0º C, 2.5º C, 4.6º C and 4.8º C.

HPLC/IC
Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 400-592510 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The continuing calibration verification (CCV) associated with batch 400-593284 recovered above the upper control limit for Fluoride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: (CCV 400-593284/44) and (CCV 400-593284/57).

Method 300.0: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 400-593284 recovered outside control limits for the following analytes: Fluoride. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Metals
Method 6020: The ICV for batch 400-593462 passed recovery/accuracy criteria which serves the ICV purpose of verifying the calibration standards. The replicate RPDs for the elements were outside of the criteria for standards but within the criteria for field samples. Data has therefore been reported and narrated accordingly.

Method 6020: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-303 (400-225791-2), MW-304 (400-225791-3), MW-308 (400-225791-4) and DUP-04 (400-225791-5). Elevated reporting limits (RLs) are provided.

Method 6020: The ICV for batch 400-595577 passed recovery/accuracy criteria which serves the ICV purpose of verifying the calibration standards. The replicate RPDs for the elements were outside of the criteria for standards but within the criteria for field samples. Data has therefore been reported and narrated accordingly.

Method 6020: The following samples were diluted due to the abundance of non-target analytes: MW-305 (400-225791-8) and DUP-07 (400-225791-9). Elevated reporting limits (RLs) are provided.

Method 6020: The ICV for batch 400-594019 passed recovery/accuracy criteria which serves the ICV purpose of verifying the calibration standards. The replicate RPDs for the elements were outside of the criteria for standards but within the criteria for field samples. Data has therefore been reported and narrated accordingly.

Method 6020: The method blank for preparation batch 400-593194 and analytical batch 400-593462 contained Boron above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

General Chemistry
Method SM 2540C: The sample duplicate (DUP) precision for analytical batch 400-592329 was outside control limits. Sample non-homogeneity is suspected.

Method SM 4500 SO4 E: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-303 (400-225791-2), MW-304 (400-225791-3), MW-308 (400-225791-4), DUP-04 (400-225791-5), MW-305 (400-225791-8) and DUP-07 (400-225791-9). Elevated reporting limits (RLs) are provided.

Re: Gulf Clean Energy Center
Statistical Analysis – March 2022 Sample Event

Dear Mr. Amos,

Groundwater Stats Consulting (GSC), formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of the groundwater data for the March 2022 sample event at Gulf Clean Energy Center. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at Gulf Clean Energy Center for the CCR program in 2016 at each of the groundwater monitoring wells. The monitoring well network for the Gypsum Storage Area originally included wells MW-202, MW-203, MW-204 and MW-205. However, further research conducted by Geosyntec Consultants, reportedly, concluded that the location of these compliance wells did not represent the zone of groundwater quality downgradient of the site; therefore, these wells would not identify whether groundwater was affected from practices at the site. As a result, these wells are not included in the statistical analysis provided in this report. The monitoring well network, as provided by Geosyntec Consultants, consists of the following wells:

- **Upgradient wells:** MW-100, MW-101, MW-107, MW-108, MW-306, and MW-307
- **Ash Landfill No. 1 (100 Series):** MW-102, MW-103, MW-104, MW-105, MW-106, MW-109, and MW-110
- **Gypsum Storage Area (200 Series):** MW-200, MW-201, and MW-206

- **Ash Landfill No. 2 (300 Series):** MW-300, MW-303, MW-304, MW-305, and MW-308

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix III** (Detection Monitoring) **-** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) **–** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series graphs and box plots for Appendix III and IV parameters at the 100, 200, and 300 series wells are provided for these wells for the above constituents. The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. For each of the well series, the time series and box plots include the upgradient wells for comparison to naturally occurring groundwater quality in the region.

Proposed background data at all wells were initially evaluated in October 2017 for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. A summary of those findings, along with the summary of the background update that was performed in March 2020, is provided below.

Power curves were provided during the initial screening to demonstrate that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

The number of constituents and downgradient wells affects both the power curves and the table value (kappa) that enter into the computation of parametric prediction limits whenever a resampling scheme is used. Thus, parametric interwell limits, which are constructed using pooled upgradient well data, for a given constituent may differ slightly across the well series, even though the background data are the same.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below

(US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

To account for varying detection limits in background data sets due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. This is done on an individual well basis for intrawell prediction limits and confidence intervals; therefore, the reporting limit for a given constituent may vary from well to well. In the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In the interwell case, prediction limits are updated with upgradient well data following each sampling event after careful screening for any new outliers. In some cases, deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs. Background data were initially screened for outliers, trends, and appropriate statistical methodology in October of 2017, and prediction limits were updated in March of 2020. Summaries of those results are presented below.

Summary of October 2017 Background Screening

Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective, in proposed background data. Suspected outliers at all wells for Appendix III and Appendix IV parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of those findings were submitted with the October 2017 report. These values maybe also be seen on the time series graphs as disconnected points and on the data pages in a lighter font.

Seasonality

No seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trend Test Evaluation

While trends may be visually identified, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, earlier data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. When the historical records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses, which were presented with the screening report, showed a few statistically significant trends. All trends noted were relatively low in magnitude when compared to average concentrations. Therefore, no adjustments were necessary at that time.

Appendix III – Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified variation among upgradient well data at Gulf Clean Energy Center for the following Appendix III parameters: calcium, chloride, pH, and sulfate. No statistically significant variation was noted for boron, fluoride, or TDS, making these constituents eligible for interwell analyses. All other constituents were further evaluated as described below for the appropriateness of intrawell testing to accommodate the groundwater quality.

Appendix III – Intrawell Method Eligibility Screening

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are conservative (i.e., lower) from a regulatory perspective, and that will rapidly identify a change in more recent compliance data from within a given well. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility. Prior to performing intrawell prediction limits, several steps are required to reasonably demonstrate that downgradient water quality does not have existing impacts from the practices of the facility.

Exploratory data analysis was used as a general comparison of concentrations in downgradient wells for all Appendix III parameters recommended for intrawell analyses to concentrations reported in upgradient wells. Upper tolerance limits were used in conjunction with confidence intervals to determine whether the estimated averages in downgradient wells are higher than observed levels upgradient of the facility. The upper tolerance limits were constructed to represent the extreme upper range of potential background levels at the site.

Either parametric or nonparametric tolerance limits were calculated based on the data characteristics that were described above for prediction limits. Parametric tolerance limits (for normal or transformed-normally distributed data) were constructed with a target of 99% confidence and 95% coverage using pooled upgradient well data for each of the Appendix III parameters recommended for intrawell analyses. For data sets with non-normal distributions, nonparametric tolerance limits were used. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As more data are collected, the background population is better represented, and the confidence and coverage levels increase.

Confidence intervals were constructed on downgradient wells for each of the Appendix III parameters exhibiting spatial variation, using the tolerance limits discussed above, to determine intrawell eligibility. Either parametric or nonparametric confidence intervals were constructed as appropriate. When the entire confidence interval is above the background limit for a given parameter, interwell methods are initially recommended as the statistical method. Note that this screening identifies whether confidence intervals are above a background limit but does not identify the reason for this occurrence. Therefore, only the wells/parameters with confidence intervals which did not exceed background limits are eligible for intrawell prediction limits.

Confidence intervals for Appendix III parameters were found to be above the background standards in at least one well for each parameter at Ash Landfill No. 1; therefore, interwell prediction limits were recommended for all Appendix III parameters at this unit. Confidence intervals were above background standards for all parameters except pH at the Gypsum Storage Area and Ash Landfill No. 2. Therefore, intrawell methods were recommended for pH and interwell methods were recommended for all other Appendix III parameters at these two units. The results of the upper tolerance limits calculations and confidence interval comparisons were presented in the background screening report.

If further evaluation confirms natural variation in groundwater at these downgradient wells, intrawell methods will be considered for these parameters. In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent, an independent study and hydrogeological investigation would be required to identify local geochemical conditions and expected groundwater quality for the region to justify an intrawell approach. Such an assessment is beyond the scope of services provided by Groundwater Stats Consulting. When there is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells, interwell prediction limits are initially selected for the statistical method until further evidence shows that the higher

downgradient concentrations are due to natural variation rather than a result of the facility.

Summary of Appendix III Background Update Summary – Conducted in March 2020

Outlier Analysis

Prior to performing prediction limits, proposed background data through March 2019 were reviewed to identify any newly suspected outliers at all wells for pH for intrawell testing, and through June 2019 at upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS for interwell testing. Visual screening was used to identify potential outliers using time series graphs. When necessary, Tukey's outlier test is used to formally test suspected outliers. No additional outlier testing was required during the background update. Previously flagged values remained excluded from statistical limits to reduce variation, better represent background conditions, and provide limits that are conservative from a regulatory perspective. As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. A complete list of flagged values follows this letter.

Mann-Whitney Evaluation - Intrawell

For pH, which is analyzed using intrawell prediction limits at each of the 200 and 300 series wells, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through May 2017 to more recent compliance samples through March 2019 to evaluate whether the groups are statistically similar at the 99% confidence level. If no statistically significant difference is found, background data may be updated with compliance data. No statistically significant differences were found between the two groups for pH except at the Gypsum Storage Area for well MW-201. However, the measurements ranged from 5.62 s.u. to 4.71 s.u., which is in line with concentrations in neighboring wells and showed only a slight decrease in more recent data. Therefore, all background data sets were updated through March 2019, and will be re-evaluated during the next background update.

In the future, if the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data may not be updated to include the newer data but will be reconsidered in the future. A summary of these results was submitted with the March 2020 report.

Trend Test Evaluation - Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate the entire record of data from upgradient wells for parameters utilizing interwell prediction limits. When statistically significant trends are identified in upgradient wells, the earlier portion of data is deselected prior to construction of interwell statistical limits if the trending data would result in statistical limits that are not conservative from a regulatory perspective. No statistically significant increasing trends were noted in upgradient wells. Statistically significant decreasing trends were identified; however, the magnitudes of the trends were low relative to average concentrations, and no adjustment of the records was required. Complete graphical results of the trend test were submitted with the background update report.

Statistical Analysis of Appendix III Parameters – March 2022

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, using background data through March 2019, are used to evaluate the March 2022 sample for pH at the Gypsum Storage Area and at Landfill No. 2 due to natural spatial variation for this parameter. However, only the 200 and 300 series wells were eligible for intrawell testing for pH, as discussed earlier. The 100 series wells are evaluated using interwell prediction limits for pH.

Interwell prediction limits, which compare the most recent sample from each downgradient well to statistical limits constructed from pooled upgradient well data, are updated during each sample event after screening for new outliers. Data from upgradient wells are periodically also re-screened for newly developing trends, which may require adjustment of the background period to eliminate the trend. No new outliers were identified during this analysis. All available upgradient well data through March 2022 were used to establish interwell prediction limits, based on a 1-of-2 resample plan, for all Appendix III parameters except for pH at the 200 and 300 series wells which is tested using intrawell prediction limits.

Complete tabular and graphical results for both intrawell and interwell prediction limits are presented following this letter. Exceedances were noted for each of the units and are listed in summary tables for intrawell and interwell prediction limits. It was noted that the reported observation for sulfate at well MW-308 is significantly higher than remaining measurements within this record which may be a result of laboratory or sampling procedures.

Trend Test Evaluation – Appendix III

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of an additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no further action is necessary.

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable. Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of natural variability in groundwater unrelated to practices at the site. Several statistically increasing and decreasing trends were noted among upgradient and downgradient wells. Complete tabular and graphical results of the trend tests follow this letter.

Evaluation of Appendix IV Parameters – March 2022

Prior to evaluating Appendix IV parameters, background data are screened through visual screening for potential outliers and extreme trending patterns that would lead to artificially elevated statistical limits. High outliers are also 'cautiously' flagged in the downgradient wells when they are distinctly different from the rest of the data. This is intended to be a regulatory conservative approach in that it will reduce the variance and thus reduce the width of parametric confidence intervals, although it will also reduce the mean and thus lower the entire interval. The intent is to better represent the actual downgradient mean. Flagging high outliers should have no effect on the lower limit of nonparametric confidence intervals. No new outliers were flagged during this analysis. A complete list of outliers follows this report.

Interwell Upper Tolerance Limits

Interwell upper tolerance limits, as appropriate, were used to calculate background limits from pooled upgradient well data for Appendix IV parameters, with a target of 95% confidence and 95% coverage for parametric limits. Parametric tolerance limits are used when data follow a normal or transformed-normal distribution as does combined radium

226 + 228. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used.

Groundwater Protection Standards

Interwell upper tolerance limits were compared to the Maximum Contaminant Levels (MCLs) and CCR rule-specified levels to determine the highest limit for use as the groundwater protection standards (GWPS) in the Confidence Interval comparisons, as described below. A table of the GWPS follows this report.

Confidence Intervals

Confidence intervals were then constructed on downgradient wells, using all historical data within a given well, for each of the Appendix IV parameters and compared to the highest limit of either the MCL or rule-specified level as discussed above. As mentioned above, well/constituent pairs containing 100% non-detect values do not require statistical analysis and a list of Appendix IV downgradient wells containing 100% non-detects follows this report. For cobalt in well MW-304, samples prior to June 2018 have been deselected to use, at a minimum, the most recent 8 samples in constructing the confidence interval rather than the entire data set in order to reflect present-day concentrations. The historical data for this constituent had higher concentrations due to a broken pipe that influenced groundwater quality at this well. Concentrations, as expected, have continued to decrease since the pipe was fixed.

Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its respective standard. Tables of the upper tolerance limits, GWPS, and confidence intervals, along with graphical comparisons against standards, and significant results (exceedances) follow this letter. The following confidence interval exceedances were noted:

100 Series Wells:
- Cobalt: MW-104
- Combined Radium 226 + 228: MW-104 and MW-110
- Mercury: MW-110

200 Series Wells:
- Combined Radium 226 + 228: MW-200, MW-201, and MW-206

300 Series Wells:
- Combined Radium 226 + 228: MW-303
- Molybdenum: MW-303

Re: Gulf Clean Energy Center
Statistical Analysis – September 2022 Sample Event

Dear Mr. Amos,

Groundwater Stats Consulting (GSC), formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of the groundwater data for the September 2022 sample event at Gulf Clean Energy Center. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at Gulf Clean Energy Center for the CCR program in 2016 at each of the groundwater monitoring wells. The monitoring well network for the Gypsum Storage Area originally included wells MW-202, MW-203, MW-204 and MW-205. However, further research conducted by Geosyntec Consultants, reportedly, concluded that the location of these compliance wells did not represent the zone of groundwater quality downgradient of the site; therefore, these wells would not identify whether groundwater was affected from practices at the site. As a result, these wells are not included in the statistical analysis provided in this report. The monitoring well network, as provided by Geosyntec Consultants, consists of the following wells:

- **Upgradient wells:** MW-100, MW-101, MW-107, MW-108, MW-306, and MW-307
- **Ash Landfill No. 1 (100 Series):** MW-102, MW-103, MW-104, MW-105, MW-106, MW-109, and MW-110
- **Gypsum Storage Area (200 Series):** MW-200, MW-201, and MW-206

- **Ash Landfill No. 2 (300 Series):** MW-300, MW-303, MW-304, MW-305, and MW-308

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix III** (Detection Monitoring) **-** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) **–** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series graphs and box plots for Appendix III and IV parameters at the 100, 200, and 300 series wells are provided for these wells for the above constituents. The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. For each of the well series, the time series and box plots include the upgradient wells for comparison to naturally occurring groundwater quality in the region.

Note that due to matrix interference and dilution differences, varying reporting limits were observed during this analysis; therefore, historic reporting limits of 0.1 mg/L for fluoride, 0.005 mg/L for lithium, and 0.0013 mg/L for selenium were substituted for all non-detects across all wells.

Proposed background data at all wells were initially evaluated in October 2017 for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. A summary of those findings, along with the summary of the background update that was performed in March 2020, is provided below.

Power curves were provided during the initial screening to demonstrate that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests the selected statistical method should provide at least 55% power at 3

standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

The number of constituents and downgradient wells affects both the power curves and the table value (kappa) that enter into the computation of parametric prediction limits whenever a resampling scheme is used. Thus, parametric interwell limits, which are constructed using pooled upgradient well data, for a given constituent may differ slightly across the well series, even though the background data are the same.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available

background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

To account for varying detection limits in background data sets due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects except in the cases discussed earlier where historical reporting limits were substituted due to laboratory matrix interference during this analysis. Substitution of the most recent reporting limit is done on an individual well basis for intrawell prediction limits and confidence intervals; therefore, the reporting limit for a given constituent may vary from well to well. In the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In the interwell case, prediction limits are updated with upgradient well data following each sampling event after careful screening for any new outliers. In some cases, deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables

and graphs. Background data were initially screened for outliers, trends, and appropriate statistical methodology in October of 2017, and prediction limits were updated in March of 2020. Summaries of those results are presented below.

Summary of October 2017 Background Screening

Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective, in proposed background data. Suspected outliers at all wells for Appendix III and Appendix IV parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of those findings were submitted with the October 2017 report. These values maybe also be seen on the time series graphs as disconnected points and on the data pages in a lighter font.

Seasonality

No seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trend Test Evaluation

While trends may be visually identified, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, earlier data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. When the historical records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses, which were presented with the screening report, showed a few statistically significant trends. All trends noted were relatively low in magnitude when compared to average concentrations. Therefore, no adjustments were necessary at that time.

Appendix III – Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified variation among upgradient well data at Gulf Clean Energy Center for the following Appendix III parameters: calcium, chloride, pH, and sulfate. No statistically significant variation was noted for boron, fluoride, or TDS, making these constituents eligible for interwell analyses. All other constituents were further evaluated as described below for the appropriateness of intrawell testing to accommodate the groundwater quality.

Appendix III – Intrawell Method Eligibility Screening

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are conservative (i.e., lower) from a regulatory perspective, and that will rapidly identify a change in more recent compliance data from within a given well. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility. Prior to performing intrawell prediction limits, several steps are required to reasonably demonstrate that downgradient water quality does not have existing impacts from the practices of the facility.

Exploratory data analysis was used as a general comparison of concentrations in downgradient wells for all Appendix III parameters recommended for intrawell analyses to concentrations reported in upgradient wells. Upper tolerance limits were used in conjunction with confidence intervals to determine whether the estimated averages in

downgradient wells are higher than observed levels upgradient of the facility. The upper tolerance limits were constructed to represent the extreme upper range of potential background levels at the site.

Either parametric or nonparametric tolerance limits were calculated based on the data characteristics that were described above for prediction limits. Parametric tolerance limits (for normal or transformed-normally distributed data) were constructed with a target of 99% confidence and 95% coverage using pooled upgradient well data for each of the Appendix III parameters recommended for intrawell analyses. For data sets with non-normal distributions, nonparametric tolerance limits were used. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As more data are collected, the background population is better represented, and the confidence and coverage levels increase.

Confidence intervals were constructed on downgradient wells for each of the Appendix III parameters exhibiting spatial variation, using the tolerance limits discussed above, to determine intrawell eligibility. Either parametric or nonparametric confidence intervals were constructed as appropriate. When the entire confidence interval is above the background limit for a given parameter, interwell methods are initially recommended as the statistical method. Note that this screening identifies whether confidence intervals are above a background limit but does not identify the reason for this occurrence. Therefore, only the wells/parameters with confidence intervals which did not exceed background limits are eligible for intrawell prediction limits.

Confidence intervals for Appendix III parameters were found to be above the background standards in at least one well for each parameter at Ash Landfill No. 1; therefore, interwell prediction limits were recommended for all Appendix III parameters at this unit. Confidence intervals were above background standards for all parameters except pH at the Gypsum Storage Area and Ash Landfill No. 2. Therefore, intrawell methods were recommended for pH and interwell methods were recommended for all other Appendix III parameters at these two units. The results of the upper tolerance limits calculations and confidence interval comparisons were presented in the background screening report.

If further evaluation confirms natural variation in groundwater at these downgradient wells, intrawell methods will be considered for these parameters. In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent, an independent study and hydrogeological investigation would be required to identify local geochemical conditions and expected groundwater quality for the region to justify an intrawell approach. Such an assessment is beyond the scope of services provided by Groundwater Stats Consulting. When there

is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells, interwell prediction limits are initially selected for the statistical method until further evidence shows that the higher downgradient concentrations are due to natural variation rather than a result of the facility.

Summary of Appendix III Background Update Summary – Conducted in March 2020

Outlier Analysis

Prior to performing prediction limits, proposed background data through March 2019 were reviewed to identify any newly suspected outliers at all wells for pH for intrawell testing, and through June 2019 at upgradient wells for boron, calcium, chloride, fluoride, sulfate, and TDS for interwell testing. Visual screening was used to identify potential outliers using time series graphs. When necessary, Tukey's outlier test is used to formally test suspected outliers. No additional outlier testing was required during the background update. Previously flagged values remained excluded from statistical limits to reduce variation, better represent background conditions, and provide limits that are conservative from a regulatory perspective. As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. A complete list of flagged values follows this letter.

Mann-Whitney Evaluation - Intrawell

For pH, which is analyzed using intrawell prediction limits at each of the 200 and 300 series wells, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through May 2017 to more recent compliance samples through March 2019 to evaluate whether the groups are statistically similar at the 99% confidence level. If no statistically significant difference is found, background data may be updated with compliance data. No statistically significant differences were found between the two groups for pH except at the Gypsum Storage Area for well MW-201. However, the measurements ranged from 5.62 s.u. to 4.71 s.u., which is in line with concentrations in neighboring wells and showed only a slight decrease in more recent data. Therefore, all background data sets were updated through March 2019, and will be re-evaluated during the next background update.

In the future, if the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data may not be updated

to include the newer data but will be reconsidered in the future. A summary of these results was submitted with the March 2020 report.

Trend Test Evaluation - Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate the entire record of data from upgradient wells for parameters utilizing interwell prediction limits. When statistically significant trends are identified in upgradient wells, the earlier portion of data is deselected prior to construction of interwell statistical limits if the trending data would result in statistical limits that are not conservative from a regulatory perspective. No statistically significant increasing trends were noted in upgradient wells. Statistically significant decreasing trends were identified; however, the magnitudes of the trends were low relative to average concentrations, and no adjustment of the records was required. Complete graphical results of the trend test were submitted with the background update report.

Statistical Analysis of Appendix III Parameters – September 2022

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, using background data through March 2019, are used to evaluate the September 2022 sample for pH at the Gypsum Storage Area and at Landfill No. 2 due to natural spatial variation for this parameter. However, only the 200 and 300 series wells were eligible for intrawell testing for pH, as discussed earlier. The 100 series wells are evaluated using interwell prediction limits for all constituents.

Interwell prediction limits, which compare the most recent sample from each downgradient well to statistical limits constructed from pooled upgradient well data, are updated during each sample event after screening for new outliers. Data from upgradient wells are periodically also re-screened for newly developing trends, which may require adjustment of the background period to eliminate the trend. No new outliers were identified during this analysis. All available upgradient well data through September 2022 were used to establish interwell prediction limits, based on a 1-of-2 resample plan, for all Appendix III parameters except pH at the 200 and 300 series wells which is tested using intrawell prediction limits.

Complete tabular and graphical results for both intrawell and interwell prediction limits are presented following this letter. Exceedances were noted for each of the units and are listed in summary tables for intrawell and interwell prediction limits. It was noted that the

reported observation for fluoride at well MW-305 is significantly higher than remaining measurements within this record which may be a result of laboratory or sampling procedures.

Trend Test Evaluation – Appendix III

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of an additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no further action is necessary.

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable. Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of natural variability in groundwater unrelated to practices at the site. Several statistically increasing and decreasing trends were noted among upgradient and downgradient wells. Complete tabular and graphical results of the trend tests follow this letter.

Evaluation of Appendix IV Parameters – September 2022

Prior to evaluating Appendix IV parameters, background data are screened through visual screening for potential outliers and extreme trending patterns that would lead to artificially elevated statistical limits. High outliers are also 'cautiously' flagged in the downgradient wells when they are distinctly different from the rest of the data. This is intended to be a regulatory conservative approach in that it will reduce the variance and thus reduce the width of parametric confidence intervals, although it will also reduce the mean and thus lower the entire interval. The intent is to better represent the actual downgradient mean. Flagging high outliers should have no effect on the lower limit of nonparametric confidence intervals. No new outliers were flagged during this analysis. A complete list of outliers follows this report.

Interwell Upper Tolerance Limits

Interwell upper tolerance limits, as appropriate, were used to calculate background limits from pooled upgradient well data for Appendix IV parameters, with a target of 95% confidence and 95% coverage for parametric limits. Parametric tolerance limits are used when data follow a normal or transformed-normal distribution as does combined radium 226 + 228. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used.

Groundwater Protection Standards

Interwell upper tolerance limits were compared to the Maximum Contaminant Levels (MCLs) and CCR rule-specified levels to determine the highest limit for use as the groundwater protection standards (GWPS) in the Confidence Interval comparisons, as described below. A table of the GWPS follows this report.

Confidence Intervals

Confidence intervals were then constructed on downgradient wells, using all historical data within a given well, for each of the Appendix IV parameters and compared to the highest limit of either the MCL or rule-specified level as discussed above. As mentioned above, well/constituent pairs containing 100% non-detect values do not require statistical analysis and a list of Appendix IV downgradient wells containing 100% non-detects follows this report. For cobalt in well MW-304, samples prior to June 2018 have been deselected to use, at a minimum, the most recent 8 samples in constructing the confidence interval rather than the entire data set in order to reflect present-day concentrations. The historical data for this constituent had higher concentrations due to a broken pipe that influenced groundwater quality at this well. Concentrations, as expected, have continued to decrease since the pipe was fixed.

Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its respective standard. Tables of the upper tolerance limits, GWPS, and confidence intervals, along with graphical comparisons against standards, and significant results (exceedances) follow this letter. The following confidence interval exceedances were noted:

100 Series Wells:

- Cobalt: MW-104 and MW-110
- Combined Radium 226 + 228: MW-104 and MW-110
- Mercury: MW-110

200 Series Wells:

- Combined Radium 226 + 228: MW-200, MW-201, and MW-206

300 Series Wells:

- Combined Radium 226 + 228: MW-303
- Molybdenum: MW-303

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 125 background values. Annual per-constituent alpha = 0.003527. Individual comparison alpha = 0.0002521 (1 of 2). Comparing 7 points to limit.
